(Winogradsky; source: Wikipedia)

Microbes are small – invisible – so studying them is not easy and the development of special, often very original and inspired, techniques has been necessary to investigate them and induce them to give up their secrets. The intrepid scientists who accepted the challenge, pioneered advances and made amazing discoveries are heroes, heroes who have earned their place in the history of microbiology. This Gallery honors these special people who opened up the field of microbiology and brought it to the incredible stage of excitement and relevance we now experience. Some of them were awarded Nobel Prizes for their work and these are portrayed in the MicroNobelHeroes Gallery.

*Let's get to know the Discovery Heroes of Microbiology
and be inspired by their brilliance and dedication to the study of our smallest friends!*
